

Press Release

Melamine film for deep structures Outstanding pressing results in terms of look and feel

Deep structures and special matte-gloss effects are in demand like never before in the industry and the market. They ensure a special feel, look and lively decor structure. The challenges increase with the depth of the structures. During the pressing process, errors can occur in the decor image.

Dieter Schuckmann, Head of Impregnation Sales: "Manufacturers of pressed sheet metal and processors in the coating sector are required to use invariably deeper structures and special matte-gloss effects, with which one can stand out from the competition. Those challenges are becoming more intense, along with the depth of the structures. When pressing, errors in the decor image or tears can occur due to a less than optimal separation effect between the melamine film and the press plate."

In addition to the areas of decor printing and lacquering, Schattdecor now also leads the international market in the area of impregnation. They are a solution provider for any challenge the customer presents.

Silvia Sardano, Sales Italy, was involved in the development work: "With our melamine film, we are ideally integrated into the production process of our customers and can serve both the demand for particularly deep decor structures and the demand for the highest quality in terms of look and feel."

Schattdecor's Italian Managing Director at Rosate, Marco Aquino, adds: "The results are maximum deep structures with special pore realism, even with synchronized pressing and especially complicated plates that have challenging structures for the processing of decors and plain surfaces."

Thanks to the special formulation, the melamine film ensures an optically optimal result, even with special sheets. In summary: Schattdecor presents the solution for perfect deep structures during the pressing process - while using sophisticated structured plates.
