TRANSFORMING RECYCLED PET INTO SURFACES PEOPLE LOVE Fineflex by Finedecor & Schattdecor

Fineflex meets all the requirements for a modern and environmentally friendly decorative surface. And it's made in Germany! With the merger of Fine Decor and Schattdecor, years of design expertise in the field of solid colors and décor printing have come together, along with a pioneering technology to produce sustainable lacquered laminate surfaces. The two companies are united in their first joint product – Fineflex.

Through a patented lacquering process, we achieve a surface with a unique feel and anti-fingerprint effect. It is particularly easy to clean and resistant to external influences. Thanks to optimum moisture resistance, Fineflex is ideal for use in kitchens and bathrooms. Due to its outstanding processing properties, Fineflex is the environmentally friendly alternative for 2D lamination, as a thermoforming film for three-dimensional surfaces and wrapping or postforming.

In a unique manufacturing process, we can produce new furniture surfaces using recycled PET material. With our stock collection of 14 solid colors in super matte and six brand new colors with a metallic effect, customers have many options to choose from to fulfill their project requirements. Additional information is available at: www.fineflex.pet.

Being mindful of current trends and environmentally aware, we are working to expand our joint product portfolio. In addition to PET-based solid colors and metallic effect films, we also offer this innovative substrate with décor printing.

Fineflex is now available as a single-layer metallic effect film. In addition to the classics Shell White, Pearl Bronze, and Pearl Gold, you can also choose from the exciting metallic colors Sky Blue, Night Blue, and Space Black.
